Precast large block linings made of lightweight concrete for railroad
tunnels. Transp.stroi. 6 no.9:11-13 S '56. (MIRA 9:11)
(Tunnels) (Lightweight concrete)

ASTVATSATUROV, R-D

AUTHOR: Kuris'ko, A.C., Engineer.

SOV/97-4-9/11

TITLE: Pre-cast Reinforced Concrete Lining to Single Track Railway Tunnels (Sbornaya zhelezobetonnyaya obdelka odnopusnykh zheleznodorozhnykh tunneley).

PERIODICAL: Beton i Zhelezobeton, 1958 Nr 4, pp 157-159.

ABSTRACT: The author describes the change in method of tunnel constructions from insitu reinforced concrete to pre-cast reinforced concrete blocks forming a tunnel lining which, in many cases, reduces the size of the excavations and material used and especially saves on construction time. Experience gained by the (Kavgioprotrans) Kavkaz Planning Institute gives a fair idea of when it is practicable to use pre-cast concrete lining for these constructions. Figure 1 shows a diagram of the relationship of the volume of the excavated material to its hardness for various types of tunnel linings. Figure 2 illustrates a diagram of the relationship between the consumption of concrete or reinforced concrete and various types of linings according to the hardness of the rock.

Card 1/3

Pre-cast Reinforced Concrete Lining to Single Track Railway Tunnels. scv/97-4-9/11

Two examples of the most economically built tunnels using insitu concrete lining were constructed by the Metrogiprotrans and Kavgioprotrans in 1956. The method of calculation worked out by Candidate of Technical Science S.A. Orlov, could be used. Further special details published in a paper by G.P. Masidze entitled "Assembly of Tunnels from Reinforced Concrete Blocks" were read at the All-Soviet Conference on reinforced concrete in Moscow in 1955. This paper was published by Gosstroyizdat in 1956. The book by R.D. Astvatsaturyan: "Precast Large Block Linings from Light Concrete for Railway Tunnels" published in "Transportnoye Stroitel'stvo, 1950, Nr 9" which deals with various aspects of linings made from pre-cast reinforced concrete. Figures 3 and 4 illustrate sections of insitu concrete tunnels. Figure 5 illustrates longitudinal and cross section of a tunnel constructed from four types of pre-cast blocks built through rock, having a coefficient of hardness "f-4". Figure 6 illustrates longitudinal and cross section of a tunnel constructed from three types of pre-cast reinforced concrete blocks. Calculation of these blocks may be carried

Card 2/3

Pre-cast Reinforced Concrete Lining to Single Track ^{SOV} 97-4-9/11
Railway Tunnels.

out by Professor S.S. Davydov's method. Figure 7 illustrates longitudinal and cross section of the pre-cast concrete lining of a circular shape used in soft rock. Figure 8 illustrates a tunnel of similar sections formed from pre-cast segmental units reinforced with strong flanges. Calculations of these circular shape linings were carried out in the Metrogiprotrans. Another method of calculation was presented by Candidate of Technical Science C.A. Orlov which takes into account the possibility of the bending of joints. This second method of calculation is more economical. There are eight figures.

AUTHOR: Astvatsatur'yan, A. T.

TITLE: Chemical composition of the lipids and fatty acids in *Vibrio comma*

SOURCE: Biokhimiya, v. 29, no. 1, 1964, 8-16

TOPIC TAGS: *Vibrio comma*, cholera, *Vibrio comma* lipid content, *Vibrio comma* acetone extract, *Vibrio comma* ether extract, *Vibrio comma* chloroform extract

ABSTRACT: Sequential extraction of a mixture of the Inaba and Ogawa strains of *Vibrio comma* with acetone, ether and chloroform in a Soxhlet apparatus yielded 3 fractions, which were then subjected to chemical analysis and paper chromatography. Chemical analysis revealed a mixture of triglycerides, phosphatides, fatty acids and bound amino acids (including lysine and arginine, among others). Chromatography of the carbohydrate fraction revealed glycerol, arabinose, glucose, glucosamine, inositol, an unidentified heptose and glycerophosphoric acid, while among the fatty acids there were oleic and linoleic acid, an unidentified unsaturated fatty acid with an intermediate position, and saturated fatty acids with 13-18 C atoms. No cholesterol was found. The acid number, saponification number, ether number and iodine number of each fatty acid were determined. Orig. art. has: 2 tables and 2 chromatograms.

TITLE: Effect of chloroprene¹ on cathepsin activity

SOURCE: AN ArmSSR. Izvestiya. Seriya biologicheskikh nauk, v. 18, no. 1, 1965, 79-84.

TOPIC TAGS: rat, liver, brain, enzyme

ABSTRACT: Rats were subjected for 2 hrs per day during 100-110 days to the action of chloroprene present in a concentration of 3 mg/l. in the air. As a result of poisoning with chloroprene, the cathepsin activity in the brain of the animals was reduced by 42.1% vs. that of control rats, the activity in the liver by 39.3%, and the activity in the kidneys by 32%. H₂S added to the tissues of the organs of poisoned rats reactivated the cathepsins, raising their activity by 29.2% in the kidney, 39.3% in the liver, and 54.5% in the brain tissue from the low level produced as a result of the action of chloroprene. The fact that the cathepsins were reactivated by H₂S indicated that the thiol groups of these enzymes, which were oxidized to S-S groups as a result of the decrease under the effect of chloroprene of the content of the natural activators of cathepsins, i.e., ascorbic acid and glutathione, were restored by reduction of the S-S groups with H₂S.
